

PC 2 - Probability distributions

Exercise 1

(Uniform distribution). Let X be a random variable with uniform distribution on $[0, 1]$. We define $Y = \min(X, 1 - X)$ and $Z = \max(X, 1 - X)$. Determine the distributions of Y and Z . Compute $\mathbb{E}[YZ]$.

Exercise 2

One says that $X \in (0, +\infty)$ follows the log-normal distribution if $\log(X) \sim \mathcal{N}(0, 1)$. What is the density of X ?

Exercise 3

Consider a random variable X having exponential distribution with parameter 1 . Let $a > 0$ be a positive real number.

1. Compute the cumulative distribution function of $Y = \min(X, a)$. Plot the function.
2. What can you say about the existence of a density for the distribution of Y ?
3. Compute $\mathbb{E}[Y]$. Hint: Use $Y = X\mathbb{1}_{X \leq a} + a\mathbb{1}_{X > a}$.

Exercise 4

Let V be a random variable with uniform distribution on $[0, \pi/2]$. Define the random variable $W = \sin(V)$.

1. Determine the distributions of W .
2. How does the distribution of W change when V has uniform distribution on $[0, \pi]$?

Exercise 5

(Cauchy distribution). Let X be a random variable with Cauchy distribution whose density is given by $f(x) = (\pi(1 + x^2))^{-1}$. Determine the distribution of $1/X$ using a change of variables.

Exercise 6

* Let $p > 0$ and an integer n such that $n > p$. Consider random variables Y_n such that nY_n has a geometric distribution $\text{Geo}(\frac{p}{n})$ with parameter $\frac{p}{n}$. Show that the characteristic function of Y_n tends to the characteristic function of an exponentially distributed random variable with parameter p .

Exercise 7

Let $\alpha > 1$ be fixed. Consider the random variable X with density given by

$$f(x) = c_\alpha x^{-\alpha} \mathbb{1}_{x \geq 1}$$

1. Determine the constant c_α .

2. For which values of p we have X belongs to L^p ?

Exercise 8

Let X and Y be two independent random variables such that X (resp. Y) has geometric distribution with parameter p (resp. q).

1. Compute $\mathbb{P}(X > n)$ for any $n \in \mathbb{N}$.
2. What is the distribution of the random variable $Z = \min(X, Y)$?

Exercise 9

Assume that $X \sim \mathcal{N}(\mu, \sigma^2)$.

1. Show that $Y = (X - \mu)/\sigma$ has standard normal distribution $\mathcal{N}(0, 1)$.
2. Compute $\mathbb{E}[|Y|]$ and $\mathbb{E}[Y^{2019}]$.
